PARLIAMENTARY RESEARCH PRESENTATION

Tanzania Livestock Policy

Implementation status and sector outcomes to 2025

The evidence supports a mixed, uneven assessment

76.9%

7.65 million agricultural households kept livestock in 2024/25.

WEAK

Advisory reach, productivity and milk-market conversion.

NOT PROVEN

No consolidated, time-bound scorecard links policy, budgets and outcomes.

Conclusion: partial and uneven performance; policy causation is not established.

English and Kiswahili assessment reports; NBS AASS 2024/25

What this review can—and cannot—establish

1. Reviews the 2006 National Livestock Policy against supplied NBS evidence.
2. Latest observation covers 1 Oct 2024–30 Sep 2025; report released Oct 2026.
3. AASS measures reported participation, stocks, output, practices and information access.

Retrospective 2025 outcomes ≠ data available to decision-makers during 2025.

Evidence boundary

Not an expenditure audit or impact evaluation. • No causal attribution to the 2006 policy. • No inference of real GDP growth from current-price shares.

AASS 2022/23–2024/25; both generated assessment reports

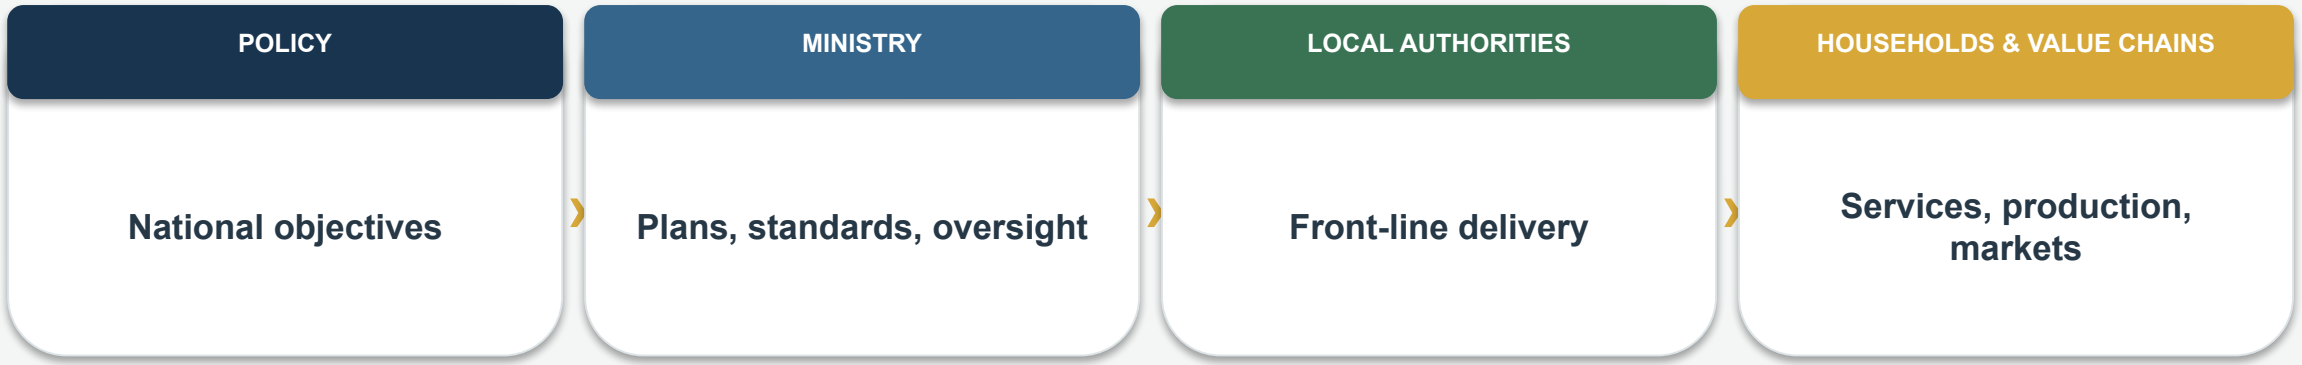

The 2006 policy is broad; measurable targets are not

- Production and breeds
- Animal health and veterinary services
- Feed, pasture, water and rangelands
- Research, training and extension
- Markets, processing and infrastructure
- Finance and coordination

The supplied policy text sets objectives and roles, but no dated national targets for productivity, extension, sales or expenditure.

National Livestock Policy (2006), printed pp. 3–4, 8–43

Delivery depends on a chain of public and local actors

Policy assigns planning and monitoring responsibilities; implementation evidence and expenditure records were not supplied.

National Livestock Policy (2006), printed pp. 44–49

Livestock keeping is widespread—but the series needs reconciliation

7.65m

livestock-keeping agricultural households

76.9%

reported participation in 2024/25

40.76m

cattle estimated at 1 Oct 2025

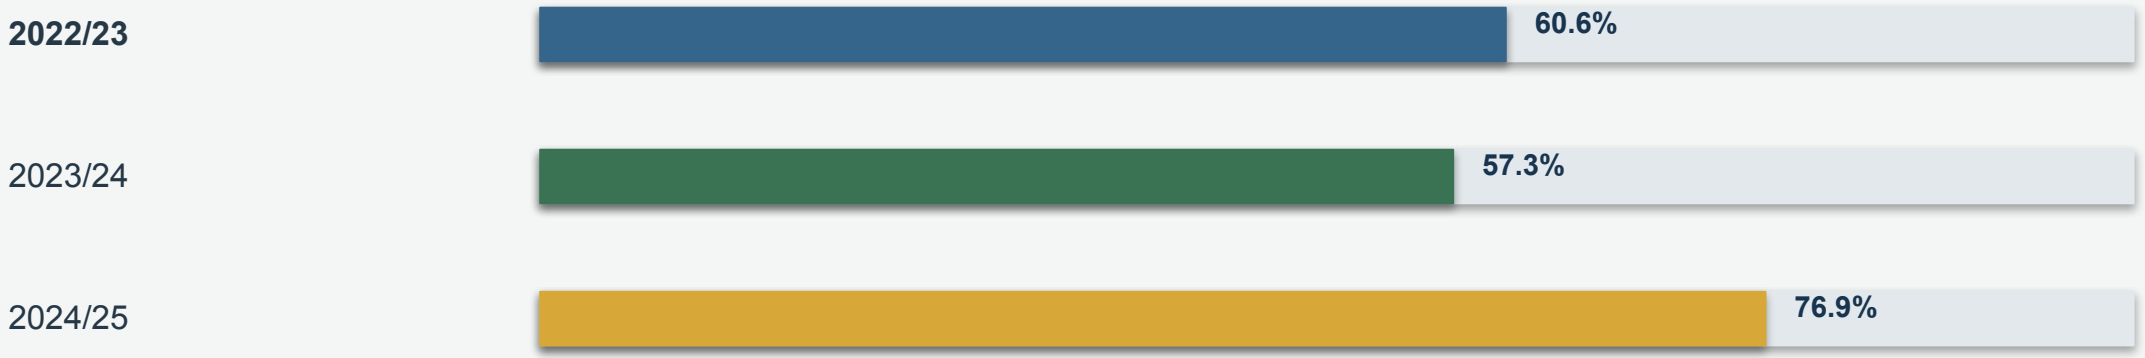

AASS participation: 60.6% (2022/23), 57.3% (2023/24), 76.9% (2024/25). Do not read the jump as a policy effect without a comparable-series note.

NBS AASS 2022/23, 2023/24 and 2024/25

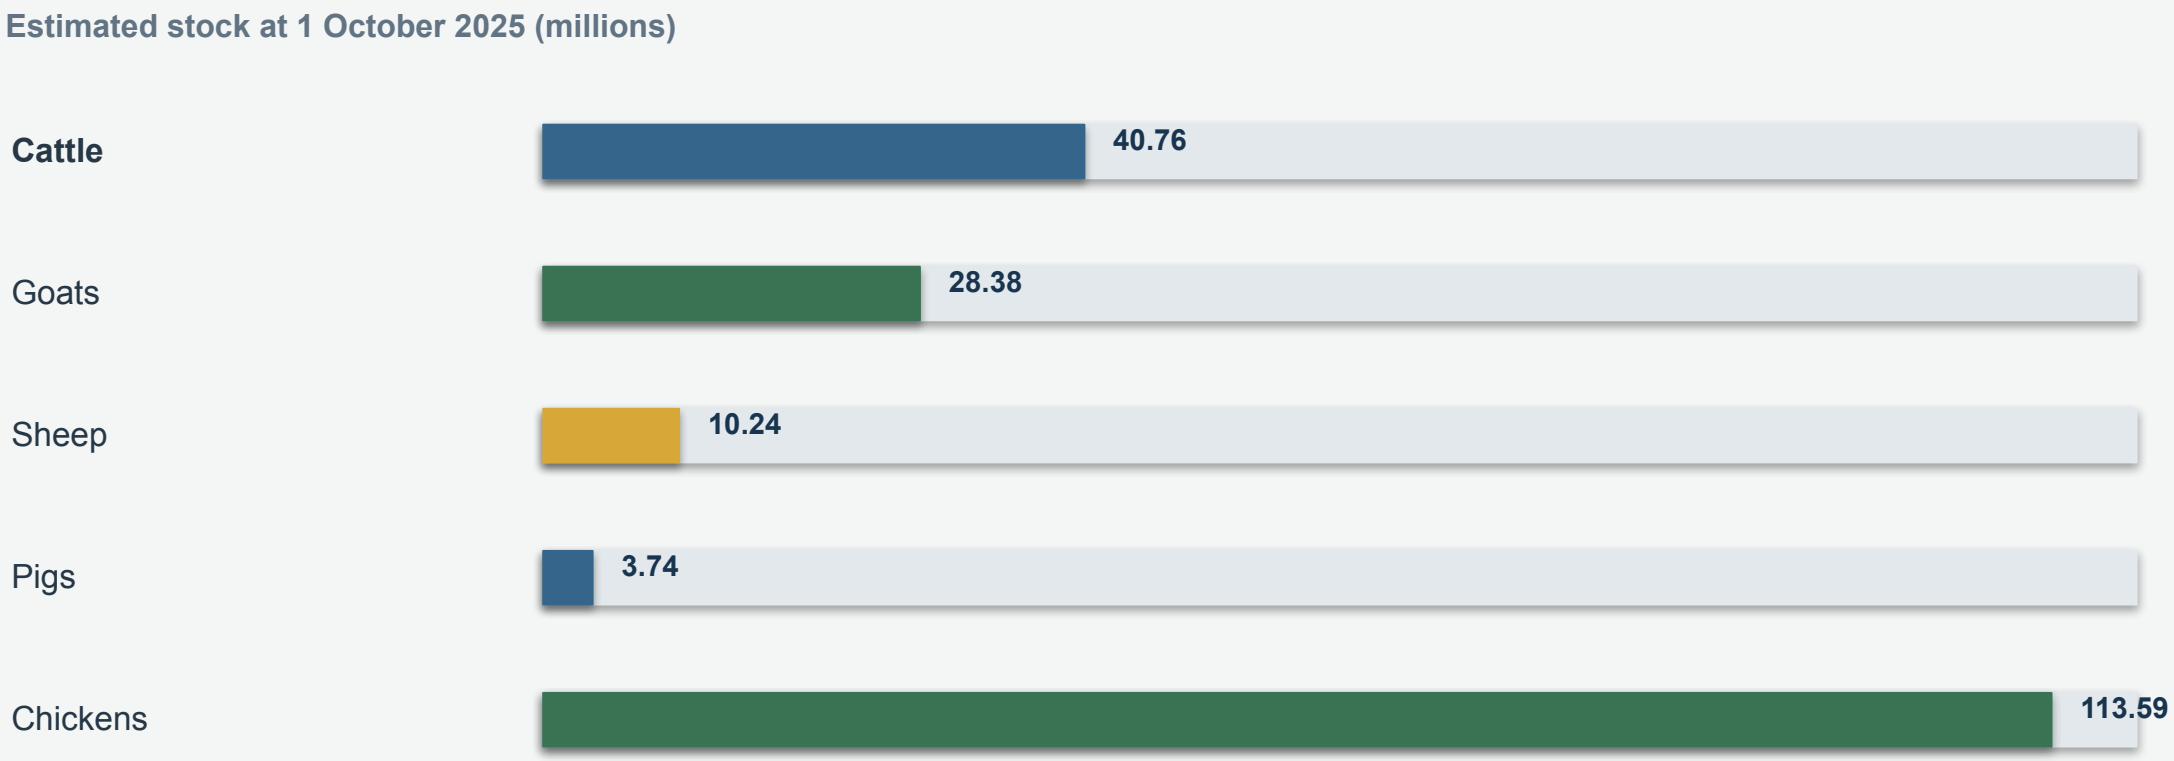

Reported participation rose sharply in 2024/25

Agricultural households reporting livestock keeping (%)

The 19.6 percentage-point rise from 2023/24 is unexplained in the supplied reports; no trend or policy attribution is made.

The livestock base is large and overwhelmingly household-raised

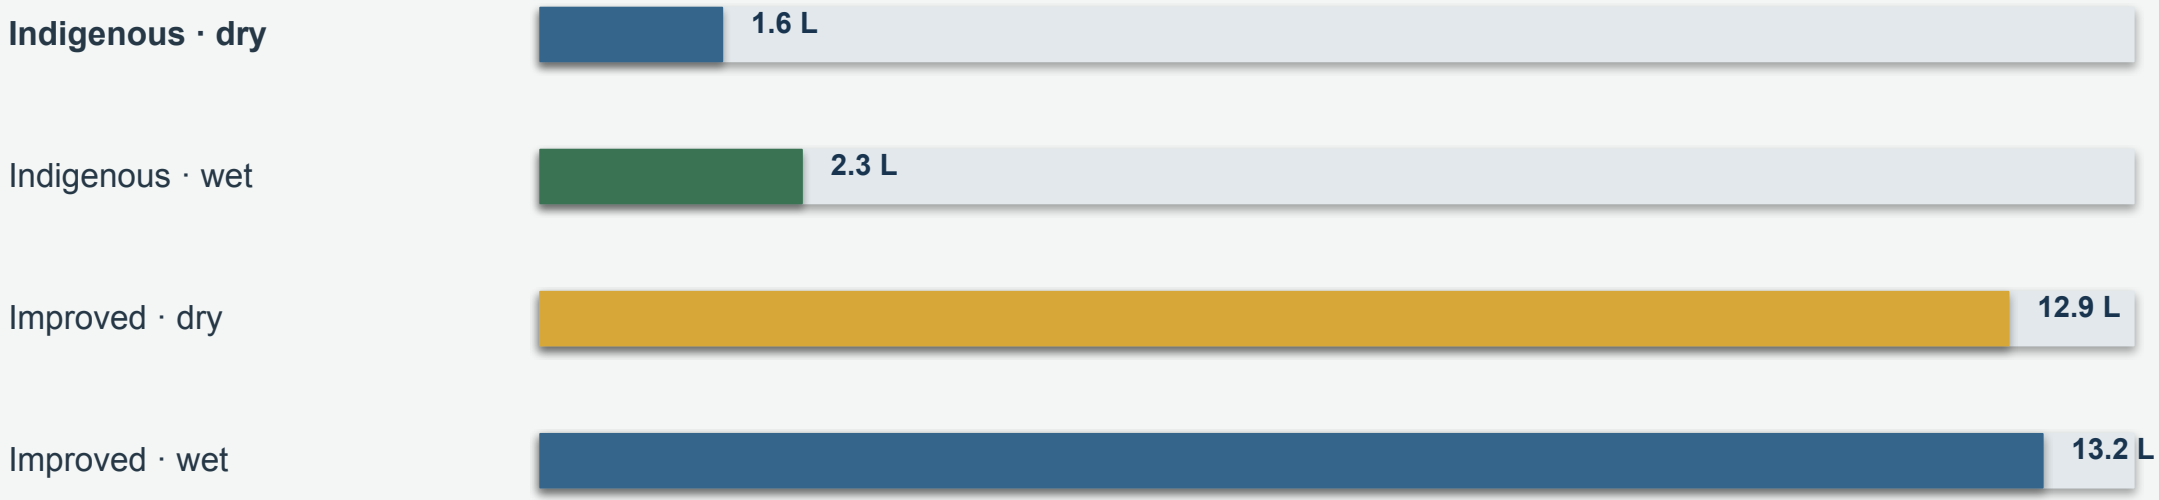

Households accounted for 99.8% of cattle, 99.9% of goats, sheep and pigs, and 96.2% of chickens.

NBS AASS 2024/25, livestock estimates at 1 Oct 2025

Milk yield differs markedly by cattle type

Average litres per cow per day

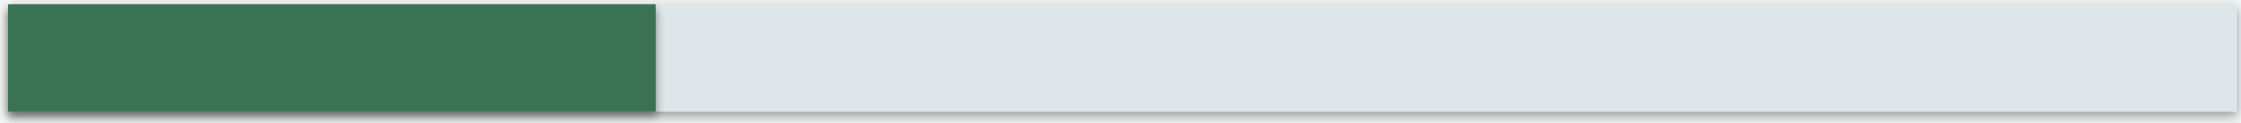

Improved-cow yield was about 8.1× indigenous in the dry season and 5.7× in the wet season. These differences do not isolate breed as the sole cause.

Production is substantial; reported milk sales are limited

4.2bn L

AASS milk output in 2024/25

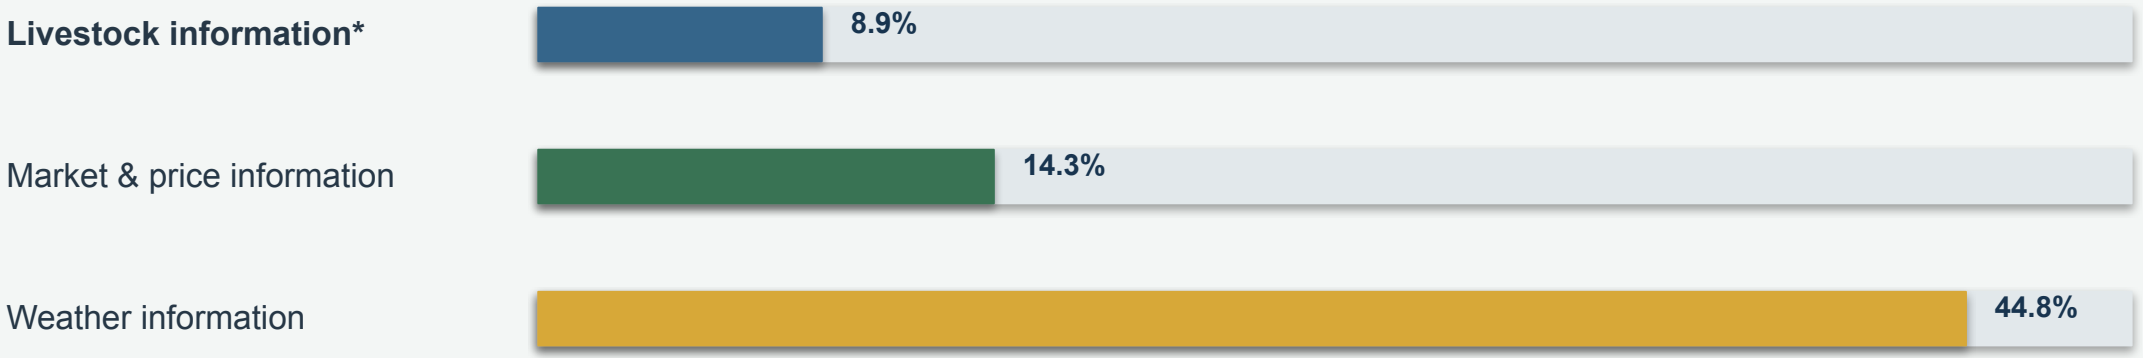

29% reported sold

71% not reported sold

The survey does not separate household use, informal trade, processing, storage or other destinations for the balance.

Reported information access is low—and one denominator is unclear

Share of agricultural households / holdings reporting access (%)

*683,922 holdings; 8.9% implies a livestock-keeper denominator, while the displayed total-holdings denominator gives ~6.9%. NBS clarification is needed.

NBS AASS 2024/25, livestock information and access tables

Extensive feeding remains dominant for indigenous stock

Extensive feeding reported

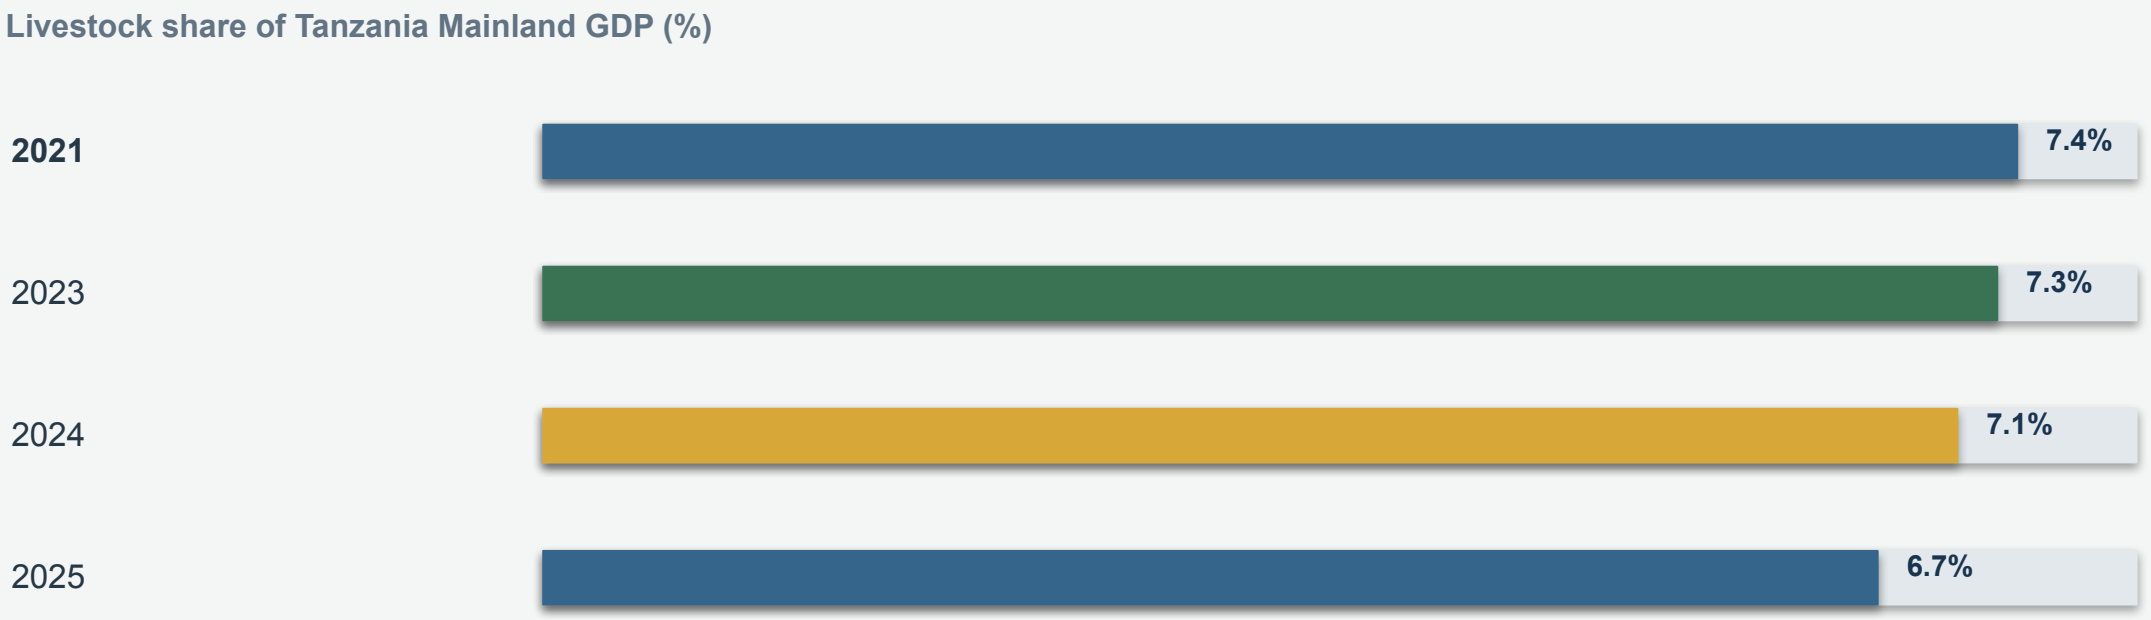

Intensive feeding reported

Feeding systems should be assessed against local resources and seasonal needs; extensive practice is not automatically unsuitable.

Livestock’s current-price GDP share has declined since 2021

2025 value: TZS 15.689 trillion at current market prices. Share movement is not a real-output series and is not proof of policy impact.

NBS Statistical Abstract 2025, Tables 5.4 and 5.6

Climate exposure and participation gaps warrant targeted scrutiny

61.8%

of agricultural households reported drought / erratic rainfall

7.2 pp

gap in livestock participation by household-head sex

78.7% vs 71.5%

male- vs female-headed agricultural households

The climate figure is agriculture-wide, not livestock-specific. The participation gap alone does not establish unequal service access or benefits.

A measurable scorecard shows uneven performance

Policy outcome	Evidence-based judgement
Household participation / scale	Mixed; series not reconciled
Productivity / intensification	Weak / not demonstrated broadly
Extension / information	Weak; reach gap observed
Commercialisation	Partial; ~29% of milk reported sold
Economic contribution	Material; relative share lower than 2021
Governance / monitoring	Not demonstrated in supplied record

Sector scale is not proof of policy effectiveness. Ratings distinguish observed conditions from attribution.

English and Kiswahili assessment reports; NBS AASS and Statistical Abstract

Several major policy outcomes remain unverified

UNVERIFIED

Animal health

Staffing, vaccination, disease prevalence, outbreak response

UNVERIFIED

Poverty & food security

No causal household or national impact measure

UNVERIFIED

Infrastructure & finance

No complete coverage, functionality or spending series

UNVERIFIED

Environment & conflict

No outcome series adequate for a policy rating

Unverified is not the same as failed; administrative, audit and evaluation evidence is needed.

Supplied policy and AASS reports; assessment limitations

Analytical framework: convert observed gaps into testable delivery questions

OBSERVED CONDITIONS	CHECK DELIVERY	TEST RESULTS
Low advisory reach\nLow milk sales\nExtensive feeding	Who received services? \nWhere and how often? \nWhat was funded?	Productivity by system\nMarket volumes / prices\nEquity and resilience

Proposed analytical framework—not an officially adopted Government framework. Correlation is not causal proof.

Four proposed workstreams address the documented shortfalls

1 Reach

District-, sex- and species-disaggregated extension plans

2 Productivity

Dry-season feed, pasture, water and husbandry support

3 Markets

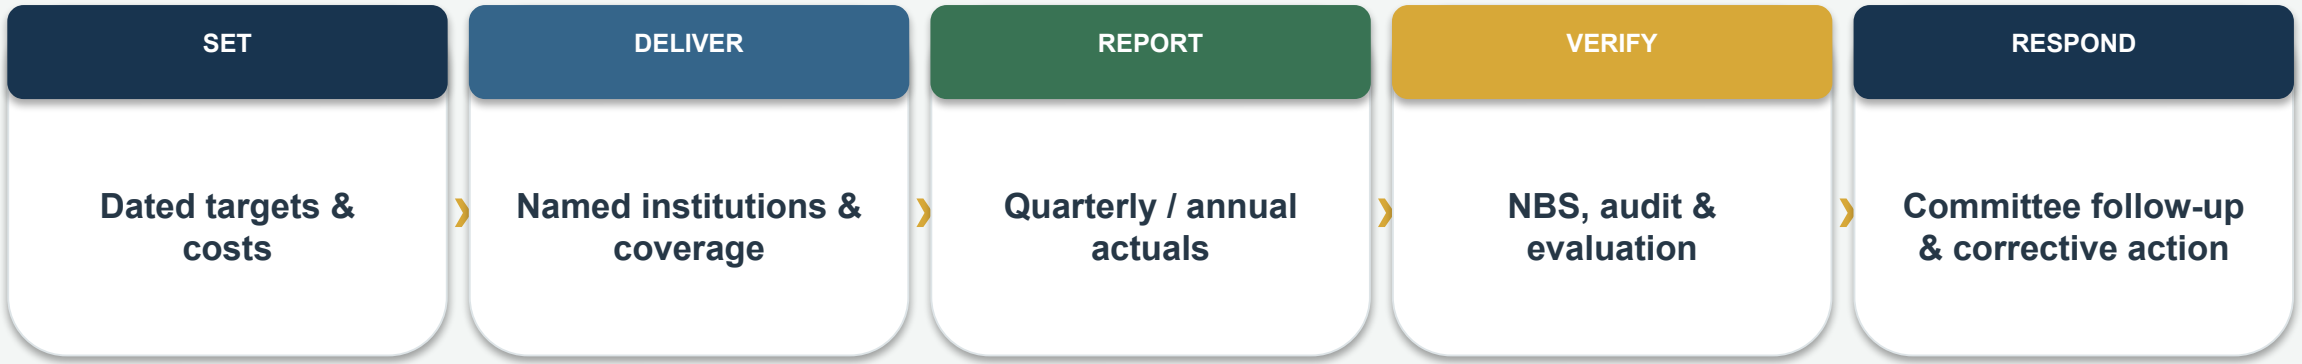

Collection, cooling, quality, processing and marketed volumes

4 Assurance

Veterinary coverage, surveillance, budgets and public reporting

These are proposed parliamentary follow-up areas, not adopted Government programmes.

A stronger accountability loop would connect plans to results

Proposed accountability cycle; the supplied record does not show a consolidated system currently in operation.

Use published baselines first; set targets only after validation

Policy outcome	Evidence-based judgement
Extension / livestock information	8.9%*; denominator to clarify
Market information access	14.3% reported
Milk marketed	~29% of output reported sold
Participation by household-head sex	78.7% male / 71.5% female
Livestock GDP share	6.7% at current prices, Mainland, 2025

Proposed dashboard indicators. Confirm definitions, coverage, cost and baseline quality before adopting annual targets.

NBS AASS 2024/25; NBS Statistical Abstract 2025

A 12-month scrutiny roadmap can sequence corrective action

MONTHS 0–3	Reconcile AASS denominators and participation series; submit policy commitment inventory.
MONTHS 4–6	Cost the delivery plan; publish veterinary, extension and market baselines.
MONTHS 7–9	Report district coverage, seasonal feed/water readiness and market performance.
MONTHS 10–12	Review results, audit gaps and corrective actions; propose policy refresh if needed.

Proposed sequencing for parliamentary follow-up; it is not an approved Government implementation timetable.

Mitigate measurement, delivery and equity risks

Incomparable survey estimates	NBS comparability note; publish definitions and confidence intervals.
Targets without budgets	Cost targets; report allocations, releases and expenditure.
Seasonal shocks	Track dry-season feed and water access, not only infrastructure counts.
Unequal reach	Disaggregate services and results by sex, district and production system.

Risk controls are proposed safeguards; the available sources do not quantify their cost.

Decision message: measure delivery before claiming success

1. The sector is large and economically material—but scale is not policy impact.
2. Observed weaknesses are specific: advisory reach, productivity, market conversion and monitoring.
3. NBS must clarify key series and denominators before performance comparisons.
4. Parliamentary follow-up should demand costed targets, disaggregated results and verification.

Evidence-led scrutiny can distinguish policy commitments, delivery and outcomes.
